

Manual

In the code there is a list of systems that the code will use to train the model.

In the same directory as the python file there needs to be a folder named datasets which contains folders of the systems (containing their csv files), with the same name as the system names in line 8 of the python code.

For this project I used the same datasets from lab2 to compare my solution to the baseline, so to use this tool you just need to download the datasets folder from the repository in the same directory as the python file from the repository.

Then, in any ide using python 3.12.4, install the libraries from requirements.pdf in the terminal using pip install and then run the code in the ide.
